Abstracts

Fresh air dehumidifiers are advanced climate control devices designed to actively reduce indoor humidity levels while simultaneously introducing filtered outdoor air, combining moisture removal with ventilation to improve indoor air quality and comfort. These systems typically integrate dehumidification components such as refrigerative or desiccant mechanisms with fans and filters that draw in external air, remove excess moisture, and circulate the conditioned air throughout the space. They are distinct from traditional dehumidifiers, which only recirculate and dehumidify existing indoor air, making fresh air dehumidifiers particularly valuable in tightly sealed buildings, high-humidity climates, or environments where stale air, odors, or pollutants need to be regularly expelled and replaced with cleaner, drier outdoor air.

The global Fresh Air Dehumidifiers market size was estimated at USD 1580.62 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
