## Abstracts

A fresh-keeping one way valve is a device used in food packaging and storage to keep food fresh and extend its shelf life. The main function of the valve is to allow gas to be discharged from the inside of the package, but not to enter the package in the opposite direction, thus effectively preventing moisture, oxygen and bacteria from the outside air from contaminating the food. It is usually installed on food packaging bags or containers to control the emission of gas inside the package, reduce adverse reactions such as oxidation and fermentation of food, and maintain the taste, color and nutritional content of the food.

The global Fresh-Keeping One Way Valve market size was estimated at USD 288.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
