Abstracts

Friction bonding adhesives are a specialized category of adhesives that utilize mechanical friction and pressure to create a bond between substrates, often through methods like spin welding, vibration welding, or ultrasonic welding, where the heat generated by friction melts or softens adhesive materials—typically thermoplastics or thermoplastic-based formulations—to form a strong, durable joint upon cooling and solidification. These adhesives are engineered to exhibit specific viscoelastic properties that allow them to generate sufficient heat under applied mechanical energy while maintaining structural integrity, and they are distinct from traditional chemical-curing adhesives as they rely primarily on physical processes rather than chemical reactions for bonding, making them particularly suitable for applications requiring rapid assembly, high strength, and resistance to environmental factors such as moisture and temperature fluctuations.

The global Friction Bonding Adhesives market size was estimated at USD 280.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
