Abstracts

Friction Stir Welding is a solid-state joining process that utilizes a non-consumable rotating tool with a specially designed pin and shoulder to generate frictional heat and mechanical deformation, thereby plasticizing materials without melting them; it is particularly advantageous for joining high-strength aluminum alloys, magnesium alloys, copper, and other materials that are challenging to weld using conventional fusion techniques, offering benefits such as reduced distortion, absence of fumes or spatter, improved mechanical properties in the weld zone, and suitability for automation in industries including aerospace, automotive, shipbuilding, and rail transportation.

The global Friction Stir Welding (Fsw) market size was estimated at USD 755.84 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
