## Abstracts

The refrigerator sensor is divided into a temperature sensor and a defrost sensor. For temperature sensors, the thermostat controls the cooling process by monitoring the temperature and then turning the compressor on and off. When the sensor senses that the refrigerator is cold enough, it turns off the compressor. If it senses too much heat, it turns on the compressor and starts the cooling process again. The defrost sensor feeds back the signal to the control board. If the judgment condition is reached, the heating and defrosting will be carried out. If it is not reached, the compressor will continue to cool.
