Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Front-side Silver Pastes for PERC Solar Cell competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Front-side silver paste for PERC cells is a conductive material specifically developed for the formation of front electrodes in PERC solar cells. It is primarily composed of high-purity silver powder, glass frit, organic vehicles, and various additives. This paste is applied via screen printing on the front surface of the solar wafer and forms low-resistance, highly conductive, and well-adhered metal gridlines after high-temperature sintering, effectively collecting and transporting photogenerated charges. Compared with conventional solar cell structures, PERC cells feature a passivated rear side to reduce recombination losses, thus imposing stricter requirements on the silver paste's conductivity, fine-line printability, contact resistance, and thermal stability.

The global Front-side Silver Pastes for PERC Solar Cell market size was estimated at USD 420.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.50% during the forecast period.
