Abstracts

Froth floating chemicals are specialized reagents used in the froth flotation process, a critical mineral separation technique that selectively separates hydrophobic materials from hydrophilic ones by attaching to air bubbles in a slurry, enabling the recovery of valuable minerals such as copper, gold, lead, and zinc from ores; these chemicals include collectors (which enhance mineral hydrophobicity), frothers (which stabilize bubbles), modifiers (which control pH and selectivity), and depressants (which prevent unwanted minerals from floating), and they are essential for improving recovery rates, grade, and efficiency in mining operations.

The global Froth Floating Chemicals market size was estimated at USD 1850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
