### Report Overview

Freezing food preserves it from the time it is prepared to the time it is eaten. Since early times, farmers, fishermen, and trappers have preserved grains and produce in unheated buildings during the winter season.[1] Freezing food slows down decomposition by turning residual moisture into ice, inhibiting the growth of most bacterial species. In the food commodity industry, there are two processes: mechanical and cryogenic (or flash freezing). The freezing kinetics is important to preserve the food quality and texture. Quicker freezing generates smaller ice crystals and maintains cellular structure. Cryogenic freezing is the quickest freezing technology available due to the ultra low liquid nitrogen temperature -196 °C (-320 °F)

Cryogenic or (flash freezing) of food is a more recent development, but is used by many leading food manufacturers all over the world. Cryogenic equipment uses very low temperature gases – usually liquid nitrogen or solid carbon dioxide – which are applied directly to the food product.'

Europe to grow at a CAGR of around 4% by 2020. As clean label products are in high demand in the European frozen food market, companies have been compelled to eliminate artificial ingredients from frozen food products to appeal to health-conscious consumers. In this region, people are willingly paying more for healthier frozen food options, as they are organic, convenient, and completely natural. Also, the manufacturers are coming up with innovative products such as limited and seasonal frozen food, which are vegan and free from preservatives.
