Report Overview

Frozen tissues, on the other hand, work very well for molecular genetic analysis – especially if the biopsy materials are dipped in liquid nitrogen in a method called “flash freezing,” and then stored in an ultra-cold freezer at less than -80 degrees Celsius. Thus, if you have a “-80” freezer and liquid nitrogen, fresh frozen tissues are easy to prepare. Frozen tissue array samples are also very useful for IHC analysis, since proteins are preserved in a native state.
