Report Overview

The fuel damage monitor is a system used to monitor whether fuel elements in nuclear reactors are damaged. It can monitor and determine the specific location of the damage in real time when a fuel element is damaged. Such monitoring systems are usually divided into two categories: one is a real-time monitoring system for fuel damage used during reactor operation, and the other is a detection device used to locate damaged fuel after shutdown. For example, the Fuel Damage Online Monitoring and Diagnosis System (FDDS) can monitor the integrity of the fuel assembly by continuously measuring online the specific activity of multiple radionuclides in the primary loop coolant of a pressurized water reactor nuclear power plant, and when damage is found, Evaluate damage characteristics to provide timely technical support for nuclear power plant operation decisions. This system provides a faster, more accurate and safer monitoring method than traditional manual sampling methods.
