Abstracts

A fuel-powered outboard motor is a self-contained propulsion system mounted externally on the stern of a watercraft, typically small to medium-sized boats such as fishing vessels, recreational runabouts, and utility craft. It operates by burning liquid fuel—commonly gasoline or diesel—to generate mechanical power through an internal combustion engine, which drives a propeller to produce thrust. These motors are characterized by their portability, modular installation, and ability to deliver high power-to-weight ratios, making them suitable for applications requiring reliable performance, extended range, and rapid refueling in environments where electric alternatives may be impractical due to limited infrastructure or operational demands. Key components include the engine block, fuel system, cooling mechanism, exhaust, and lower unit with gearing and propeller assembly, with designs optimized for marine conditions such as corrosion resistance and water submersion capability.

The global Fuel Powered Outboard Motor market size was estimated at USD 3400.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
