Abstracts

A full cell solar module refers to a photovoltaic panel constructed using standard-sized silicon solar cells, typically measuring 156mm x 156mm or similar dimensions, without any cutting or division of the cells prior to assembly. These modules are characterized by their use of intact, uncut solar cells interconnected in a series or parallel configuration to form a complete panel, which distinguishes them from half-cell or shingled modules where cells are split to reduce resistive losses and improve performance under partial shading. The design leverages mature manufacturing processes and offers a balance between efficiency, durability, and cost-effectiveness, making it a common choice in residential, commercial, and utility-scale solar installations where reliability and straightforward production are prioritized.

The global Full Cell Solar Module market size was estimated at USD 306000.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
