### Report Overview

A full color electronic paper module is a type of display module that can generate full color images and graphics. Unlike traditional electronic paper displays that only support black and white or grayscale images, the full color electronic paper module is capable of displaying images with a wide range of colors. The full color electronic paper module consists of an array of microcapsules, each containing different colored pigments such as red, green, and blue. These pigments can be controlled individually to produce the desired color and intensity. When an electrical charge is applied to the microcapsules, the pigments rearrange themselves to display the desired colors, forming a full color image. Similar to other electronic paper technologies, the displayed image remains visible even without a power source, making it energy-efficient. Full color electronic paper modules offer several advantages. They provide a high-quality, paper-like viewing experience with low power consumption. The reflective nature of the display allows for excellent visibility under various lighting conditions, including direct sunlight. The modules also have wide viewing angles, ensuring that the displayed content can be seen clearly from different perspectives.
