Report Overview

Full-half-bridge driver devices are a series of bridge driver power management integrated circuits (PMIC) that contain two or more power transistors and are used as switches under the control of external devices. These transistors are usually internally configured as paired series connections (called half-bridges), so any given pair of transistor nodes can be connected to either of the two power tracks. This type of device is often used to convert the low level signal provided by a controller (such as a microcontroller) into the larger power signal required to operate an executor (such as a step motor or a brushless motor).
