Abstracts

Full Power Wind Converter (FPC) refers to a type of wind turbine generator system where the power electronics interface, typically a back-to-back voltage source converter, handles the full rated power of the generator. Unlike partial-scale converters, FPCs decouple the generator's electrical frequency from the grid frequency, allowing variable-speed operation that maximizes energy capture across a wide range of wind speeds. This technology enables enhanced grid support capabilities, such as reactive power control and low-voltage ride-through, and is commonly used with permanent magnet synchronous generators (PMSGs) or wound rotor synchronous generators. By processing the entire power output, FPCs improve turbine efficiency, reduce mechanical stresses, and facilitate compliance with modern grid codes, making them a cornerstone of contemporary high-capacity wind energy systems.

The global Full Power Wind Converter market size was estimated at USD 3418.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.45% during the forecast period.
