Abstracts

The Full Spectrum Evidence Search System is a forensic equipment mainly used for the search and recording of physical evidence, which has a wide - range spectral response capability and can detect various types of evidence. Usually, its spectral response range is between 150nm and 1100nm, covering the deep - ultraviolet, visible, and near - infrared spectral ranges. This enables it to detect evidence that is not easily visible to the naked eye under different spectral conditions. It can conduct a wide - range search and high - definition recording of fingerprints, palm prints, blood stains, urine, sperm, DNA traces, and other biological traces on various objects. It is widely used in crime scene investigations and forensic identifications. For example, it can realize the functions of long - distance large - area finger and palm print search, close - range fingerprint shooting, medium - distance potential blood trace search, and document inspection. The Full Spectrum Evidence Search System adopts a super - large scientific research - level image transmission sensor and a back - illuminated CMOS UV - sensitive chip, with extremely high sensitivity and super - weak trace detection ability. Some systems are also equipped with scientific - level electron noise reduction technology, which can separate background noise through digital FPGA and DSP noise reduction technologies to obtain clear high - contrast images.

The global Full Spectrum Evidence Search System market size was estimated at USD 3762.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.60% during the forecast period.
