Abstracts

Full-spectrum Small Animal In Vivo Imaging System is a kind of medical - scientific research instrument, which is mainly used for non - invasive real - time monitoring and visualization of biological processes in small animals such as mice and rats. It uses optical markers (such as fluorescent proteins, fluorescent dyes, or bioluminescent molecules) to specifically label target cells, tissues, or molecules. These markers emit light signals under specific conditions, and the imaging system captures and records these light signals through a high - sensitivity optical imaging device, so as to achieve real - time monitoring and visual analysis of the biological processes inside living animals. It is widely used in tumor research, drug development, neuroscience, cardiovascular research, gene therapy, and regenerative medicine, etc., which can provide a powerful tool for life science research.

The global Full-spectrum Small Animal In Vivo Imaging System market size was estimated at USD 194.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.30% during the forecast period.
