Abstracts

Full throw printing glaze is a specialized ceramic coating applied to the entire surface of a three-dimensional object, such as tableware, decorative items, or sanitaryware, using a process where the glaze is sprayed or poured uniformly to achieve complete, seamless coverage. This technique ensures that even complex or irregular shapes receive an even, durable finish, enhancing both aesthetic appeal and functional properties like water resistance, hardness, and chemical stability. The glaze composition typically includes silica, fluxes, stabilizers, and colorants, which fuse during firing to form a glass-like layer that bonds with the ceramic body, providing protection, gloss or matte effects, and design consistency across the product.

The global Full Throw Printing Glaze market size was estimated at USD 325.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
