Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Fullerene Derivatives PCBM competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. PCBM is a fullerene derivative of the C₆₀ buckyball (or C₇₀) that was first synthesized in the 1990s. It is an electron acceptor material and is often used in organic solar cells (plastic solar cells) or flexible electronics in conjunction with electron donor materials such as P3HT or other conductive polymers. PCBM, including C₆₀-PCBM and C₇₀-PCBM derivatives, remains one of the most widely used electron acceptor materials in organic photovoltaics (OPVs) and organic electronics. C₆₀-PCBM offers excellent electron mobility, processing compatibility, and thermal stability, while C₇₀-PCBM provides enhanced light absorption in the visible range, improving device efficiency. Although non-fullerene acceptors (NFAs) have gained prominence in recent years, PCBMs retain significant value due to their mature fabrication processes, stable molecular structure, and broad compatibility with donor materials. In particular, C₇₀-PCBM is finding increasing use in high-efficiency OPVs and photodetectors, driven by its superior optical properties. The global PCBM market continues to expand steadily. Synergistic development in raw materials, device processing, and downstream applications further supports market resilience. Looking forward, the rising demand for sustainable energy solutions and lightweight electronics ensures that PCBMs will remain a key material in the evolving organic electronics industry, balancing performance, stability, and cost.

The global Fullerene Derivatives PCBM market size was estimated at USD 62.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
