Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Fullerene and Derivatives competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Fullerene is an allotrope of carbon whose molecules consist of carbon atoms connected by single and double bonds so as to form a closed or partially closed mesh, with fused rings of five to seven atoms. The molecules may have hollow sphere- and ellipsoid-like forms, tubes, or other shapes. Fullerene derivatives are compounds obtained by chemically modifying or functionalizing fullerene molecules. Fullerenes and their derivatives are gaining momentum across various sectors due to their unique cage-like structure, excellent electron-accepting properties, and strong antioxidant activity. C60 and C70 fullerenes are widely used in organic photovoltaics (OPVs), superconducting materials, and advanced skincare products. Derivatives like PCBM and PEG-functionalized fullerenes are crucial in organic electronics, biosensing, and drug delivery systems. With growing demand for renewable energy, advanced materials, and precision medicine, the fullerene market is poised for substantial expansion. The Asia-Pacific region, particularly China, South Korea, and Japan, is expected to drive the majority of market growth in the coming years, supported by increased R&D investment and industrial applications.

The global Fullerene and Derivatives market size was estimated at USD 208.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
