## Abstracts

The Fully Automatic Coercimeter is a high-precision instrument used to measure the coercivity (Hc) of magnetic materials. Coercivity refers to the ability of a magnetic material to retain its magnetization after the external magnetic field is removed. The fully automatic coercimeter, through an automated control system, accurately measures and records the magnetization curves of materials under various magnetic field strengths, providing precise coercivity values. This device features high stability and a high level of automation, making it widely used in the research and quality control of electromagnetic, permanent magnet, and soft magnetic materials. With its easy operation and precise data, it is suitable for rapid testing in both laboratories and production lines.

The global Fully Automatic Coercimeters market size was estimated at USD 115.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
