Abstracts

The fully automatic hammer cyclone mill uses a high-speed rotating hammer to strongly impact and shear the sample, and uses the cyclone separation principle to separate the fine powder produced by grinding from the coarse particles, thereby achieving fast and uniform grinding of the sample. During the working process, the sample is sent into the grinding chamber, and is repeatedly impacted and sheared by the high-speed rotating hammer, and is gradually crushed into fine particles. At the same time, the airflow in the grinding chamber forms a cyclone, which discharges the fine powder through a specific outlet, while the coarse particles continue to be further ground in the grinding chamber until the required particle size requirements are reached. The fully automatic hammer cyclone mill is easy to operate, and the user only needs to follow the instructions or prompts on the operating interface.
