Report Overview

The fully automatic liquid based thin layer cell slice staining machine is a laboratory instrument used for preparing thin layer cell samples for cytological examination. Its design objective is to achieve automation of cell slicing and staining, which is usually manually completed by laboratory technicians. The working principle of the machine is to collect liquid cell samples, such as cervical or urine samples, and use thin layer technology to disperse them on the slide. Then, the machine automatically cuts the sample into thin layers and stains the cells to make them visible under a microscope. This machine typically uses a combination of physical and chemical methods to slice and stain cells, such as laser cutting and hematoxylin and eosin staining. The fully automatic liquid based thin layer cell slicing and staining machine aims to improve the efficiency and accuracy of cell sample preparation, and reduce the risk of human error and mutation. It is usually used in clinical laboratories to diagnose various diseases, such as cancer, infection, and inflammation. Overall, fully automated liquid based thin layer cell slicing and staining machines are important tools in cytology and pathology, capable of quickly and accurately preparing cell samples for diagnosis and research.
