Abstracts

The fully automatic permanganate index analyzer is an instrument and equipment used for water quality analysis, mainly used to measure the permanganate index (also known as potassium permanganate index, chemical symbol COD-Mn or COD_KMnO₄) in water. The permanganate index is an important indicator for evaluating the oxidation of organic matter in water, especially for assessing the degree of pollution in water bodies. This analytical instrument can automatically complete sample processing, reagent addition, reaction progress, data recording, and result calculation. By measuring the consumption of permanganate in the sample under certain conditions, the total amount of organic matter or the concentration of oxidizable organic matter in the water sample can be indirectly reflected, thereby determining the degree of water pollution.

The global Fully Automatic Permanganate Index Analyzer market size was estimated at USD 85.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
