## Abstracts

A Semiconductor Laser Scribe Machine is a vital tool used in the process of singulating, or separating, individual die (integrated circuits) from a larger silicon wafer during integrated circuit (IC) manufacturing. The Semiconductor Laser Scribe Machine market is experiencing significant growth, driven by several key factors:

- 1. Rising Demand for Integrated Circuits (ICs):** The ever-increasing demand for electronic devices like smartphones, laptops, and Internet-of-Things (IoT) gadgets translates directly to a growing need for ICs. As chip complexity increases, more die (individual circuits) are placed on each wafer. Laser scribing becomes crucial for efficiently separating these die from the larger wafer.
- 2. Miniaturization and Advanced Packaging:** The trend towards smaller and more powerful ICs necessitates precise singulation techniques like laser scribing. Advanced packaging technologies, like Fan-Out Wafer-Level Packaging (FOWLP) and Package-on-Package (PoP), involve stacking multiple die. Laser scribing offers the necessary control and flexibility for singulation in these scenarios.
- 3. Advantages of Laser Scribing over Dicing:** Compared to traditional dicing (sawing), laser scribing offers several advantages:
  - Higher Precision:** Laser beams create cleaner and more precise scribes with minimal material damage.
  - Reduced Heat-Affected Zone (HAZ):** Minimized heat generation protects sensitive circuitry within the die.
  - Flexibility:** Adaptable to various wafer sizes and die shapes

The global Fully Automatic Semiconductor Laser Scribe Machine market size was estimated at USD 406.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
