Abstracts

Fully Humanized Monoclonal Antibody is an antibody that has been entirely engineered from human sources, with no original non-human components. Unlike humanized monoclonal antibodies, which retain some animal-derived regions, fully humanized antibodies are created using techniques like phage display or transgenic mice to produce antibodies that are completely derived from human genes. This results in antibodies that are more likely to be well-tolerated by the human immune system, reducing the risk of adverse reactions and making them ideal for therapeutic applications, such as treating cancer, autoimmune diseases, and infectious diseases.

The global Fully Humanized Monoclonal Antibody market size was estimated at USD 2485.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.70% during the forecast period.
