Abstracts

The fully redundant electronic chassis system is a chassis architecture implemented through electronic control, which uses a fully redundant design to ensure that the vehicle can still operate safely when key components fail. The system replaces traditional mechanical connections with wire control technology (such as wire control steering, wire control braking, wire control throttle, etc.) and provides an independent backup system for each key function, thereby improving the safety, reliability and control accuracy of the vehicle. The fully redundant design ensures that even if an electronic control unit fails, the backup system can take over the operation. It is widely used in autonomous driving and high-end electric vehicles, especially L4 and L5 level autonomous driving systems.

The global Fully Redundant Electronic Chassis System market size was estimated at USD 305.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.20% during the forecast period.
