Report Overview

Fungal-based pesticides, also known as mycoinsecticides or mycopesticides, are a type of biopesticide derived from naturally occurring fungi that target and control specific pests. These pesticides work by infecting and killing insects, mites, or other pests, offering an environmentally friendly alternative to chemical pesticides. The fungi used in these biopesticides typically invade the pest's body, multiply inside it, and eventually cause the pest's death through mechanisms like toxin production or nutrient depletion. Fungal-based pesticides are selective, meaning they usually target specific pests without harming non-target organisms, including beneficial insects, animals, and humans. They are increasingly used in agriculture as a sustainable pest management strategy, reducing the reliance on synthetic chemicals and minimizing environmental impact.

The global Fungal Based Pesticides market size was estimated at USD 920 million in 2023 and is projected to reach USD 2430.83 million by 2032, exhibiting a CAGR of 11.40% during the forecast period.
