Abstracts

Invasive fungal disease (IFD) refers to severe infections caused by fungi invading human tissues and bloodstream, leading to tissue damage, organ dysfunction, and inflammatory responses. It is especially prevalent among immunocompromised patients such as organ transplant recipients and cancer patients, with an incidence rate of 20% to 40%, becoming a significant cause of mortality in these populations. To enable early diagnosis and effective treatment, most hospitals worldwide have adopted non-invasive laboratory diagnostic techniques such as the G test and GM test. This report covers the equipment and reagents used for fungal infection diagnosis, specifically focusing on G test and GM test methodologies. Invasive fungal diseases (IFDs) have a high incidence among immunocompromised patients, and early diagnosis remains challenging. Currently, non-invasive laboratory diagnostic techniques such as the G test and GM test are widely used globally for early detection of fungal infections. These methods detect fungal antigens in serum, providing relatively rapid and non-invasive diagnostic options, especially suitable for immunosuppressed patients. However, despite their widespread adoption, these diagnostic methods still have limitations in sensitivity and specificity, and require high technical expertise from operators. Additionally, in some regions, the availability of equipment and reagents is still insufficient, limiting their global accessibility. Therefore, improving the accuracy of diagnostic methods, reducing costs, and expanding their availability worldwide remain pressing issues. With advancements in molecular biology, artificial intelligence, and digital pathology, the field of fungal infection diagnosis is moving towards higher efficiency, precision, and intelligence. For instance, deep learning algorithms have been applied to automatically classify and identify fungal species in microscopic images, enabling rapid and accurate detection without the need for staining, significantly improving diagnostic efficiency and accuracy. Moreover, the establishment of digital pathology image databases provides rich data support for automated detection and classification of fungal infections, promoting

research and application in this field. In the future, integrated diagnostic platforms combining artificial intelligence and molecular diagnostic technologies are expected to become mainstream in fungal infection diagnosis, offering more comprehensive, rapid, and accurate diagnostic services. The primary driver for the development of fungal infection diagnostic technologies is the urgent need for early diagnosis and precise treatment. Especially among immunosuppressed patients, early diagnosis and timely treatment are crucial for improving survival rates. However, technological advancements face several barriers. Firstly, the high cost of advanced diagnostic equipment and reagents may limit their application in resource-limited areas. Secondly, the application of artificial intelligence and digital pathology technologies requires large amounts of high-quality data, and the acquisition and sharing of such data face challenges related to privacy protection and ethical issues. Lastly, the promotion and application of these technologies require corresponding training and education to ensure operators can proficiently master new technologies. Therefore, addressing issues such as cost, data sharing, and personnel training will be key to advancing this field.
