Abstracts

Furandicarboxylic acid (FDCA) is a renewable platform chemical derived from biomass carbohydrates such as fructose, glucose, or cellulose, and serves as a sustainable alternative to petroleum-based terephthalic acid (TPA) used in the production of polyethylene terephthalate (PET). As a monomer, FDCA is primarily utilized to synthesize polyethylene furanoate (PEF), a bio-based polymer with superior barrier properties, thermal stability, and mechanical strength compared to conventional PET, making it highly suitable for applications in packaging (especially beverages and food), textiles, fibers, and engineering plastics. Its chemical structure, featuring two carboxylic acid groups attached to a furan ring, enables it to act as a key building block for green chemistry innovations, including polyesters, polyamides, and plasticizers, aligning with global trends toward circular economy and reduced carbon footprint.

The global Furandicarboxylic Acid market size was estimated at USD 1025.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Furandicarboxylic Acid market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
