## Abstracts

Furniture Durability Testing refers to a technical testing process that uses a series of standardized or customized experimental methods to simulate the stress states and wear processes of furniture under conditions such as long-term use, daily wear and tear, load pressure, and environmental impacts. This is used to evaluate the furniture's endurance in terms of structural stability, material wear resistance, functional reliability, and ultimately determine whether it meets design standards, industry regulations, or usage requirements. Its core goal is to verify whether the furniture can maintain basic structural integrity, normal function, and safety performance within its expected service life, avoiding problems such as breakage, deformation, and failure caused by long-term use. This not only provides manufacturers with a basis for quality improvement, but also provides consumers and regulators with a standard for judging product reliability.

The global Furniture Durability Testing market size was estimated at USD 216.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
