Abstracts

Fused cast AZS refractories are high-performance ceramic materials produced through an electric arc furnace melting process, combining alumina (Al?O?), zirconia (ZrO?), and silica (SiO?) to form a dense, corrosion-resistant structure with exceptional thermal stability and mechanical strength. These materials are primarily utilized in glass manufacturing furnaces, where they line critical areas such as melting tanks, superstructures, and forehearths due to their superior resistance to glass corrosion, low glass phase exudation, and minimal contamination of molten glass. Their application extends to other high-temperature industrial processes, including incinerators and certain metallurgical furnaces, where resistance to aggressive chemical environments and thermal shock is paramount. The fused casting process ensures minimal porosity and a homogeneous microstructure, distinguishing AZS from conventional sintered refractories and making it indispensable in demanding thermal applications where longevity and purity are critical.

The global Fused Cast Azs Refractories market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
