Abstracts

Fused silica Optical windows are highly transparent optical components made from fused silica, a pure form of quartz glass. They are used in a variety of applications due to their unique properties and characteristics. One of the main advantages of fused silica optical windows is their high transmission in the ultraviolet (UV), visible, and infrared (IR) spectrums, making them ideal for use in optical systems. They have a high level of optical clarity and low levels of absorption, scatter and refractive index variations, which makes them suitable for applications that require high precision and accuracy. Fused silica optical windows are also known for their low thermal expansion coefficient, which means that they exhibit minimal change in their physical dimensions when exposed to changes in temperature. This makes them ideal for use in high-temperature environments, such as in laser systems, where stability is crucial. They are also highly resistant to thermal shock, which makes them ideal for use in applications that require rapid temperature changes.

The global Fused Silica Optical Windows market size was estimated at USD 353.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
