Abstracts

G.652 single-mode fiber is a communication optical fiber that complies with the ITU-T G.652 standard of the International Telecommunication Union. It is designed to support single-mode transmission, that is, only one mode of optical signal is transmitted in the optical fiber, thereby achieving long-distance, high-speed data transmission. The characteristics of this optical fiber are that it has a small core diameter and a large mode field diameter, which effectively reduces modal dispersion and improves the transmission quality of the signal. The advantage of G.652 single-mode optical fiber is that it can provide excellent transmission performance in the two wavelength windows of 1310 nanometers and 1550 nanometers, while having low water peak attenuation and good nonlinear characteristics, which enables it to have higher bandwidth and lower attenuation in long-distance communications. It is an important basic material for building high-speed and efficient communication networks. In addition, the compatibility and stability of G.652 single-mode optical fiber have also been widely recognized by the industry, ensuring its reliability in different environments and application conditions.

The global G.652 Single Mode Fiber market size was estimated at USD 730.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
