Abstracts

Silicon (Si) is the most common element used for semiconductor products. It has long history as a material of semiconductor and is used in a wide range of applications and fields. Other semiconductor elements include germanium (Ge) and carbon (C), which are called single-elemental semiconductors. On the other hand, there are also materials called compound semiconductors which include multiple elements, such as gallium arsenide (GaAs), indium phosphide (InP), gallium nitride (GaN), and so on. Compared to crystal of single element semiconductors, these compound semiconductors have more crystal defects and are broken more easily, so it is difficult to enlarge wafers of those materials. Also, another demerit is that compound semiconductors require more cost to obtain raw materials and manufacture them than Si semiconductors. However, compound semiconductors have the advantage of high-speed signal processing compared to Si semiconductors. As electrons move faster inside compound semiconductors than inside Si, they are suitable for high-performance communication devices that deal with high-frequency signals. Therefore, GaAs semiconductors are widely used in communication devices such as cellular phones, base stations, and satellite communications. This report studies the wafer foundry for GaAs (Gallium Arsenide). In GaAs Foundry market, currently the key players are mainly located in China Taiwan, key players include WIN Semiconductors Corp., AWSC, GCS (Global Communication Semiconductors), Wavetek, Chengdu Hiwafer Semiconductor, Sanan IC, MACOM, etc.

The global GaAs Foundry market size was estimated at USD 853.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
