Report Overview

MMIC is the abbreviation of monolithic microwave integrated circuit. It uses a series of semiconductor process methods to manufacture passive and active components on a semi-insulating semiconductor substrate, and connect them to form a function for microwave (or even millimeter wave) frequency bands. Circuit. It includes a variety of functional circuits, such as low noise amplifier (LNA), power amplifier, mixer, upconverter, detector, modulator, voltage controlled oscillator (VCO), phase shifter, switch, MMIC transceiver front end, Even the entire transmit/receive (T/R) component (transceiver system). Due to the high electron mobility of MMIC substrate materials (such as GaAs, InP), wide band gap, large operating temperature range, and good microwave transmission performance, MMIC has low circuit loss, low noise, frequency bandwidth, and large dynamic range. , High power, high additional efficiency, strong ability to resist electromagnetic radiation, etc.
