Abstracts

GABA receptors are a class of receptors that respond to the neurotransmitter gamma-aminobutyric acid (GABA), which is the major inhibitory neurotransmitter in the central nervous system of vertebrates. There are two types of GABA receptors: GABAA and GABAB. GABAA receptors are ligand-gated ion channels (also called ionotropic receptors), while GABAB receptors are G protein-coupled receptors (also called metabotropic receptors). It has long been recognized that the rapid response of neurons to GABA is blocked by bicuculline and bitter taste compounds due to direct activation of the anion channel. This channel was subsequently referred to as the GABAA receptor. The rapidly responding GABA receptors are members of the Cys-loop family of ligand-gated ion channels. The slower response to GABA is mediated by the GABAB receptor, which was originally defined based on pharmacological properties.

The global GABA Receptor Modulators market size was estimated at USD 2069.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.50% during the forecast period.
