Abstracts

Gadolinium(III) chloride is an inorganic compound with the chemical formula $GdCl_3$, primarily used as a precursor in the synthesis of other gadolinium-based materials, most notably gadolinium-containing contrast agents for magnetic resonance imaging (MRI), as well as in specialized applications such as phosphors, catalysts, and as a dopant in optical glasses and ceramics. As a hygroscopic solid, it is typically handled and sold in anhydrous or hexahydrate forms, with purity levels often exceeding 99.9% being critical for high-performance uses, particularly in medical and electronics sectors where trace impurities can significantly impact functionality. Its role is largely intermediate; while not an end-product itself, it serves as a foundational input in manufacturing processes where gadolinium's unique magnetic and luminescent properties are leveraged.

The global Gadolinium(III) Chloride market size was estimated at USD 15.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
