Abstracts

Gallium Arsenide Epitaxy is a single crystal thin layer material epitaxially grown on gallium arsenide substrate. As a second-generation semiconductor, gallium arsenide (GaAs) is expensive and is known as the "semiconductor aristocrat". Gallium arsenide is the most mature compound semiconductor material after "silicon" recognized by the international community today. It has superior characteristics such as high frequency, high electron mobility, high output power, low noise and good linearity. It is one of the most important supporting materials for the optoelectronics and microelectronics industries. The second generation of semiconductors represented by gallium arsenide is widely used in the manufacture of high-frequency, high-speed, high-power, low-noise, high-temperature resistant, and radiation-resistant integrated circuits. It has developed into a key technology for "modern electronic information products" and "information highways". The 5G chip market is very good and the products are in short supply. Gallium arsenide (GaAs) is an indispensable component for optoelectronics and mobile phone network high-frequency communications. In recent years, with the surge in the application of the Internet of Things (IoT), Internet of Vehicles, and AI (artificial intelligence), countries have accelerated the deployment of 5G infrastructure. In addition, the introduction of facial recognition function by Apple iPhoneX has driven a surge in demand for gallium arsenide VCSEL and high-end communication components.

The global Gallium Arsenide Epitaxy market size was estimated at USD 452.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
