Report Overview:

Gallium is a soft, silvery metallic element with an atomic number of 31 and the chemical symbol Ga. Solid gallium has a low melting temperature (~29 degrees Celsius, or °C) and an unusually high boiling point (~2,204 °C). Because of these properties, the earliest uses of gallium were in high-temperature thermometers and in designing metal alloys that melt easily. The development of a gallium-based direct band-gap semiconductor in the 1960s led to what is now one of the most well-known applications for gallium-based products— the manufacture of smartphones and data-centric networks.

The Global Gallium Market Size was estimated at USD 337.75 million in 2023 and is projected to reach USD 434.81 million by 2029, exhibiting a CAGR of 4.30% during the forecast period.
