Report Overview:

A galvanic isolated gate driver is a device used in power electronics systems to provide electrical isolation between the control circuitry and high-power switching devices such as insulated gate bipolar transistors (IGBTs) or metal-oxide-semiconductor field-effect transistors (MOSFETs). It is designed to protect sensitive control circuitry from high-voltage spikes, noise, and other potential hazards that may occur in the high-power section of the system. The term "galvanic isolation" refers to the complete separation of electrical circuits using isolation techniques such as transformers or optocouplers. In the context of gate drivers, galvanic isolation ensures that there is no direct electrical connection between the control circuit and the high-power switching device, thus preventing the transmission of potentially damaging voltage spikes or currents.

The Global Galvanic Isolated Gate Driver Market Size was estimated at USD 151.54 million in 2023 and is projected to reach USD 212.55 million by 2029, exhibiting a CAGR of 5.80% during the forecast period.
