Abstracts

Gamma intramedullary nail refers to a specialized orthopedic implant used for the surgical stabilization of hip fractures, particularly pertrochanteric and subtrochanteric fractures. It is an intramedullary device, meaning it is inserted into the medullary cavity of the femur, and features a lag screw that slides within the nail to allow controlled compression of the fracture site during healing. Designed with a specific proximal curvature and a distal locking mechanism, the Gamma nail provides rotational stability and load-sharing capabilities, making it a common choice for treating unstable fracture patterns in elderly and osteoporotic patients. Its design aims to minimize soft tissue disruption, reduce surgical time, and promote earlier weight-bearing compared to extramedullary fixation systems.

The global Gamma Intramedullary Nail market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
