Abstracts

Gamma irradiation systems are industrial-scale equipment designed for the sterilization of medical devices, pharmaceuticals, food products, and other materials by exposing them to controlled doses of ionizing radiation from a radioactive isotope source, typically cobalt-60 or cesium-137. These systems operate within shielded chambers to ensure safety and are utilized across sectors requiring high sterility assurance levels, including healthcare, food safety, and research. The technology works by disrupting microbial DNA, effectively eliminating pathogens without leaving chemical residues or significantly raising product temperature, making it suitable for heat-sensitive items. Applications extend beyond sterilization to include polymer modification, gemstone color enhancement, and materials research, driven by the need for reliable, scalable, and regulatory-compliant decontamination methods.

The global Gamma Irradiation Systems market size was estimated at USD 252.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
