Report Overview

Gamma Knife Radiosurgery (GKRS) is a non-invasive neurosurgical procedure that uses highly focused radiation beams to target and treat brain tumors and other neurological disorders. Unlike traditional surgery, GKRS does not require incisions, making it a preferred treatment option for patients with inoperable tumors or those seeking a less invasive approach. The procedure is highly precise, delivering radiation directly to the affected area while minimizing damage to surrounding healthy tissue. GKRS is typically performed in a single session, offering patients a convenient and effective treatment option with minimal recovery time.

The market for Gamma Knife Radiosurgery (GKRS) is experiencing steady growth driven by several key factors. One of the primary market drivers is the increasing incidence of brain tumors and neurological disorders, leading to a growing demand for advanced treatment options like GKRS. Additionally, technological advancements in radiation therapy have improved the precision and effectiveness of GKRS, making it a more attractive option for both patients and healthcare providers. Moreover, the rising awareness about the benefits of minimally invasive procedures and the expanding healthcare infrastructure in developing countries are further fueling the adoption of GKRS globally. Overall, the market trend for GKRS is expected to continue on an upward trajectory as more patients and healthcare providers recognize the advantages of this innovative treatment approach.
