Abstracts

Gamma rays collimators are precision devices designed to restrict and direct the paths of gamma rays emitted from radioactive sources or medical isotopes, ensuring that only rays traveling in specific directions pass through while blocking scattered or divergent radiation. These instruments are critical components in applications such as medical imaging (e.g., SPECT scanners), nuclear physics research, industrial radiography, and radiation therapy, where spatial resolution, dose control, and signal accuracy are paramount. They typically consist of dense, high-atomic-number materials like lead or tungsten, engineered with precisely aligned channels or apertures that filter gamma radiation based on geometric and absorption principles.

The global Gamma Rays Collimators market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
