Abstracts

Gammaretroviruses are retroviral vectors in laboratory studies. These vectors are critical for gene therapy and gene transfer. They are so helpful because their genomes are simple and easy to use. Gammaretroviruses have a wide range of implications for animals. They have been linked to various diseases, including cancer, specifically leukemias and lymphomas, neurological diseases, and immunodeficiencies in multiple species. Gammaretroviruses, like other retroviruses, reverse transcribe a positive single strand RNA into double stranded DNA. The double-stranded DNA is highly stable and easily integrated into the host genome. Moloney murine leukaemia virus, xenotropic MuLB-related virus, feline leukaemia virus, and feline sarcoma virus are some examples of the virus. According to the World Health Organization, lung cancer is the leading cause of cancer death, followed by breast cancer and colorectal cancer. Breast cancer, lung cancer, prostate cancer, colon cancer, and rectum cancer are the most frequent cancers. The rising frequency of cancer, genetic illnesses, and infectious diseases is boosting demand for vector-based gene treatments, cell therapies, and vaccines, which is one of the primary drivers of the global gammaretroviral vector market.

The global Gammaretroviral Vector market size was estimated at USD 6514.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.00% during the forecast period.
