Report Overview

Gammaretroviruses are retroviral vectors in laboratory studies. These vectors are critical for gene therapy and gene transfer. They are so helpful because their genomes are simple and easy to use. Gammaretroviruses have a wide range of implications for animals. They have been linked to various diseases, including cancer, specifically leukemias and lymphomas, neurological diseases, and immunodeficiencies in multiple species. Gammaretroviruses, like other retroviruses, reverse transcribe a positive single strand RNA into double stranded DNA. The double-stranded DNA is highly stable and easily integrated into the host genome. Moloney murine leukaemia virus, xenotropic MuLB-related virus, feline leukaemia virus, and feline sarcoma virus are some examples of the virus.
