Abstracts

Gas atomized copper powder refers to a fine metallic powder produced through a process where molten copper is disintegrated into droplets by high-pressure gas jets, typically nitrogen or argon, resulting in spherical particles with controlled size distribution, high purity, excellent flowability, and good sinterability. This method ensures uniformity in particle morphology and minimizes oxidation, making the powder suitable for applications demanding precise material properties, such as additive manufacturing (e.g., 3D printing), metal injection molding (MIM), conductive pastes and inks for electronics, brazing alloys, and surface coatings. The atomization process allows for customization of particle sizes, which can range from a few micrometers to over 100 micrometers, depending on industrial requirements, and the spherical shape enhances packing density and electrical conductivity in end-use products.

The global Gas Atomized Copper Powder market size was estimated at USD 456.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
