Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Gas Atomized Precision Powder for 3D Printing competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Gas Atomized Precision Powder for 3D Printing is a class of metal powders produced by inert-gas atomization that deliver tight particle-size distribution, high purity and excellent flowability required for metal additive manufacturing. Production in 2024 totaled 372,632 tons at an average price of USD 7,600 per ton. Typical single-line annual capacity was about 1,000 tons and the industry average gross margin in 2024 was about 29%. Upstream relied on base metals such as iron, copper, aluminum, nickel and titanium, high-purity inert gases and atomization equipment, with representative suppliers including Rio Tinto, Vale, Norsk Hydro, Linde, and ALD Vacuum Technologies. The midstream involved feedstock preparation, atomization, sieving and surface treatment, along with rigorous quality control and certification processes that determine powder consistency and AM processability. Downstream demand came from metal additive manufacturing processes such as direct metal laser sintering, selective laser melting and electron beam melting, with representative customers including EOS, GE Additive, SLM Solutions and 3D Systems. The market outlook for Gas Atomized Precision Powder for 3D Printing remains structurally positive as metal additive manufacturing accelerates its penetration into aerospace, automotive, energy equipment and high-performance industrial components. Demand is shifting toward finer, higher-purity powders with tighter particle-size control as end users pursue more complex geometries, higher part reliability and improved mechanical properties. At the same time, large-format printers and multi-laser systems are driving a rapid increase in powder consumption per production line, creating long-cycle, stable growth momentum. In our view, suppliers with strong atomization technology, high-purity metal

feedstock capability and consistent batch quality will capture disproportionate share as the industry moves from prototyping toward scaled serial manufacturing.

The global Gas Atomized Precision Powder for 3D Printing market size was estimated at USD 2832.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
