Report Overview:

Gas Chromatography Systems is used for gas chromatography analysis.

Chromatography is a technique for separating chemical substances that relies on differences in partitioning behaviour between a flowing mobile phase and a stationary phase to separate the components in a mixture.

Gas chromatography is also used to monitor industrial processes automatically: gas streams are analyzed periodically and manual or automatic responses are made to counteract undesirable variations.

Two types of gas chromatography are encountered: gas-solid chromatography (GSC) and gas-liquid chromatography (GLC). Gas-solid chromatography is based upon a solid stationary phase on which retention of analytes is the consequence of physical adsorption. Gas-liquid chromatography is useful for separating ions or molecules that are dissolved in a solvent.

The Global Gas Chromatography Systems Market Size was estimated at USD 1509.27 million in 2023 and is projected to reach USD 2069.24 million by 2029, exhibiting a CAGR of 5.40% during the forecast period.
